LEGACY TO CONTENT MIGRATION

Legacy databases contain business-critical information that must be retained for a long time. Owning and maintaining legacy databases can cause significant expenses.

Our service allows the archiving of virtually any legacy database (we do also Cobol) into IBM Content Manager. Migrating data from legacy systems allows the safe decommissioning of the servers as data is converted into documents and stored into the IBM ECM repository for long-term archiving and storage. By moving legacy data to the IBM ECM -based repository it is possible to give users a significantly enhanced user experience and usability using IBM Content Navigator.

The procedure to migrate a legacy database is straightforward:

- Identify valuable data in the database
- Develop mapping from the data-> meaningful business entities to be archived
- Develop a presentation for the archive data (=document templates)
- Map the data using Elinar's migration tool
- Run the conversion
- Configure user access using IBM Content Navigator
- Test

IBM DOCUMENT MANAGER MIGRATION

We can migrate Document Manager solutions into IBM Content Navigator or Case Manager.

We have a long history of working with IBM Document Manager (DM). This allows us to migrate customer environments into a more modern browser-based user experience provided by IBM Content Navigator.

A migration project

A typical migration project involves the following steps:

- Analyze the current DM solution
- Perform a gap analysis on current and new functionality
- Develop a plan to fill the gaps using Navigator plugins and other software
- Develop a new solution design on Content Navigator or Case Manager
- Migrate data using Elinar's migration tool
- Test & deploy new solution
- Re-energize the solution by enabling new capabilities available on a modern platform.

Content migration services

CONTENT REPOSITORY TO CONTENT

Repository migration – Elinar tools allow content migration from the following repositories:

- IBMContent Manager, Enterprise Edition (CM8)
- IBMContent Manager (P8)
- IBM Lotus Notes
- IBMContent Manager OnDemand
- IBMQuickr (both Java and Domino versions)
- IBMConnections
- Microsoft SharePoint
- CIMS-compatible repositories
- Legacy archives like Mobius, Control-D and MultiArchive
- IBM Content Integrator-supported repositories
- Elinar can support any other content source but it may require the development of an easy-to-write connector module.

We can process any supported archive, apply system and user mapping as you need. We also use optional content classification or content analytics to obtain new or changed metadata. And at the end, we store the content in the new repository.

Target Repositories - We can migrate content to the following repositories:

- Content Manager, Enterprise Edition (CM8)
- IBMContent Manager (P8)
- IBMContent Manager OnDemand
- IBMConnections
- Microsoft SharePoint
- CIMS-compatible repositories
- IBMContent Integrator-supported repositories

Obtaining a content migration service

The services are available globally. Elinar don't sell migration tools separately; we can offer the most cost-efficient way to migrate data by providing a productized service. Our pricing structure is as follows: A one-time fee for the migration tool + migration services work = hassle-free, cost-efficient migration.
